

# “Man and Nature”: The Legacy of America’s Gendered Environment

HST 397A (#22219607)

MW 3:30-4:45

Professor Brittany Fremion

This interdisciplinary course explores how socially constructed gender roles have shaped our perception of nature over time, particularly the ways women and men have used gender differences to distinguish environmental values. This class is divided into three parts: an introduction to gender studies and environmental history, a gender analysis of American environmental history through the present, and student projects that engage course concepts, issues, and themes.

Fall 2012
